EDTECH × AI

CampusPilot AI

A clearer path from college skills to career readiness

We help placement-focused students identify skill gaps and turn a target job role into a practical, step-by-step preparation plan.

PROPOSED USER FLOW

01 Choose target role

02 Map skill gaps

03 Follow roadmap

THE PROBLEM

Career preparation is fragmented across courses, resumes, projects and interview resources. Students often struggle to decide what to learn next.

OUR FIRST SOLUTION

A simple profile-to-roadmap flow: target role + current skills → prioritized skill gaps, project suggestions and a four-week action plan.

INITIAL CUSTOMER

College students preparing for internships and placements, especially those without access to personalized career mentoring.

STAGE: IDEA ONLY

No product launch, customer traction or validated results are being claimed.

Start narrow. Prove value. Expand responsibly.

Our first goal is not to serve every learner. It is to help one focused group of students make better weekly career-preparation decisions.

BEACHHEAD MARKET

Placement-focused college students pursuing internships and entry-level roles. Expand later to placement cells and institutions if student value is demonstrated.

BUSINESS MODEL HYPOTHESIS

Free core roadmap for students; possible paid advanced tools or institution subscriptions. Pricing and willingness to pay still need validation.

ALTERNATIVES TODAY

Students use job portals, online courses, resume tools, AI chatbots and peer/placement guidance. These solve parts of the journey; our hypothesis is to connect them into one actionable plan.

VALIDATION PLAN — NEXT 30 DAYS

1. Interview 15–20 students across colleges. 2. Test a clickable/simple prototype. 3. Measure roadmap usefulness, weekly follow-through and repeat usage. 4. Refine or stop based on evidence.

WHAT WE NEED FROM THIS PROGRAM

Mentorship to sharpen the customer problem, introductions to pilot students/placement cells, and feedback on the product and business model. We are seeking learning and validation first—not claiming funding is required to build a proven business.

Market sizing and willingness to pay are open questions; we will quantify them after customer discovery.

A small first build, with measurable learning

Founder: Ritesh Kumar Singh • CSE (Data Science) student • Solo founder at idea stage

WEEK 1

Discover

Interview students; map current workflows and top pain points.

WEEK 2

Prototype

Build a simple role + skills input and roadmap output.

WEEK 3–4

Test & decide

Run a 15–20 student pilot; measure usefulness and follow-through.

BIGGEST RISK

Students may prefer free existing tools, or the roadmap may feel generic. We must prove it helps users take useful action—not just generate recommendations.

WHY THIS FOUNDER

As a student navigating skills, projects and placement preparation, I understand the workflow personally. I bring a Data Science learning background and will validate the problem before expanding the product.

THE ASK: mentorship + access to pilot students + honest feedback to validate product-market need.
